

# Breathalyser Unit

Electronic Monitoring System

The breathalyser takes the user's photo while measuring the alcohol level and sends it to the server along with the measurement results. The server can request alcohol measurement at random intervals. Voice calls can be made with the person being monitored via breathalyser. In case of a power outage, it can remain operational for up to 2 days thanks to its internal battery. It triggers an alarm notification in case of tampering, movement, or power outage.

It is a part of the electronic monitoring system and can be paired with the electronic ankle bracelet product over BLE technology and can be used as a pair.
